How timesheet hours are mapped to KRAs

Agentic PMS · Mindgate — the rule behind every number on the KRA coverage screen. It reports coverage; it does not produce a rating.

1 · How a logged hour finds its KRA

Rows are grouped into **work items** first, so an item is decided once, not once per log — then, in strict order:

	Rule	Why it ranks there
1	**Log Title** — the uploaded log names one of the person's KRA titles (since 22 Oct)	The log itself says which KRA; HR fills it from the template's list
2	**Explicit mapping** — a human said "this item serves that KRA"	A fact somebody asserted
3	**KRA name** — the item is named after a KRA on the sheet	Somebody chose to write it there
4	**Keyword match** — the KRA's own words appear in the item text	A guess about someone else's free text
5	**Nothing**, and the screen says so	The engine is allowed to be silent

A Log Title that is **not** one of the person's KRA titles is flagged and left unplaced — never guessed from the item name — until it is corrected or a manager maps it. A log with no Log Title goes straight to rule 2.

A mapping beats a keyword because on the client's own month the keyword-only formula gave **0% coverage**, and forcing keywords to fit put 88 hours of delivery work under *Training and team Upskill*. Keywords match **item name and description only** — never the sprint or project, where one word would tag a whole month — and only at word boundaries, so `rca` cannot match `sarcastic`.

Ambiguity is reported, not resolved. An item matching two KRAs goes to **neither**, and both are named — choosing the first, longest or heaviest would be arbitrary, and arbitrary means hours on the wrong objective. A manager resolves it with one dropdown.

Two escape hatches. *Not KRA work* removes an item from the denominator and **requires a reason on screen**. *Not measured from timesheets* marks a KRA hours can never cover, so it is reported separately rather than sitting as a permanent zero.

2 · What the numbers mean

Denominator throughout: **considered = logged − excluded**.

Number	How it is computed
Hours placed	attributed ÷ considered. Ambiguous and unmapped hours are not attributed
KRA coverage	covered weight ÷ scorable weight — **by weight, never by count**
Effort alignment	1 − (Σ of abs(actual share − target share)) ÷ 2
Score	coverage × 50% + compliance × 30% + value-add × 20%

Coverage is weighted because counting rewards breadth over value: every hour in one KRA scored 14%, an hour each across seven scored 100%. **Alignment exists because coverage cannot see proportion** — one hour on a 40% KRA and a hundred on a 5% one is full coverage. Alignment is blank, not zero, when nothing is placed. Every weight, threshold and band lives in a **table, not in code**.

3 · A worked example, on real rows

144 hours · two items · seven KRAs, one not measurable from timesheets.

Step	Result
Tap N Pay matches **two** KRAs on keywords	ambiguous — 40h to neither, both named
Hours placed	**72.2%** — below the 80% minimum, so **no score**, and the reason is printed
Manager maps *Tap N Pay* to *TD, BD analysis*	one dropdown, one save
Hours placed → coverage → alignment	**100%** → 20÷50 = **40%** → 1−(1.2÷2) = **40%**
Compliance **85.7%** → score	**B**

Alignment stays at 40% at 100% placed, because 104 of the 144 hours sat on a single 10% KRA — the number doing its job.

4 · The gate

A score appears only when **HR has switched auto-scoring on** *and* **mapped hours reach the minimum** (80% by default). Otherwise the screen prints one plain sentence per missing thing: a grade computed on a fraction of the evidence is not a measurement, it is an argument.

Closing a month **snapshots** its figures with the configuration that produced them. The rollup weights percentages **by the hours behind them**, not by month, and a manager may override a settled month with a recorded reason. **It does not feed the proposed rating, the distribution or the increment kitty** — and the screen says so.
